FUNCTION: Receptor for ADP and ATP coupled to G-proteins that inhibit the adenylyl cyclase second messenger system. Not activated by UDP and UTP. Involved in platelets aggregation. SUBCELLULAR LOCATION: Integral membrane protein.
TISSUE SPECIFICITY: Highly expressed in the platelets, lower levels in the brain. Lowest levels in the platelets, pluster levels in the datenal gland. Expressed in the spinal cord and the fetal brain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               $\times CCCCCCCCCCCCCCCCC\times T \times T \ti \times T \
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    polypeptide. The encoding DNA is deposited under the accession number ATC No: 209003. The invention provides two human G-protein coupled receptor polypeptides. The polypeptides are human Epstein-Barr Virus (EBV)-induced G-protein coupled receptor, designated EBI-2 polypeptide and a human endothelium-differentiation gene (EBO) like G-protein coupled receptor, designated EBI-1 like G-protein coupled receptor. Vectors comprising the EBI-2 and EBG-1-like G-protein coupled receptor. Vectors comprising the EBI-2 and EBG-1-like polypeptides encoding DNA can be used to transform host cells for the recombinant production of the proteins. Agonists for G-protein coupled receptors can be used for the treatment of asthma, Parkinson's disease, acute heart failure, bypotension, urinary retention and osteoporosis. Antagonists can be used for the treatment of hypertension, angina pectoris, myocardial infarction, ulcers, asthma, allergies, psychoses, depression, migraine, vomiting, stroke, eating disorders, migraine headaches, cancer and benign prostatic hypertrophy. The products can also be used for detection, diagnosis and drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

The present amino acid sequence is the hCHNB, an endogenous human corphan G protein-coupled receptor (GPCR), expressed in left and right cerebellum, kidney and lung. The hCHNB cDNA was identified using full length EST (expressed sequence tag) 764455 as a probe.

The orphan GPCR of the invention, like all GPCRs has seven transmembrane calpha helices with an extracellular N-terminus and an intracellular C-terminus. However, no endogenous ligands has yet been identified for the proteins of the invention. The orphan GPCRs may be used in the identification of their endogenous ligands, and to screen potential GPCR agonists and antagonists for use as pharmaceutical agents. The proteins can also be used in the study of GPCR-mediated signalling cascades, and to elucidate their precise role in normal and diseased human conditions. Nucleic acid encoding human orphan GPCRs may be used for tissue localisation expression analysis to provide information about their protein in healthy and pathological states.

                                                                                                                                                                                                                                                         The present sequence shows the 15625 receptor protein. It is a novel G-coupled protein receptor (GPCR). The CDNA for this protein was isolated by screening a human cDNA library with sequences homologous to other GPCRs. The 15625 receptor protein is expressed in the glial cells of the brain. It is also expressed in several other tissues. The 15625 receptor protein may be useful for producing antibodies which can be used to detect the presence of the receptor protein. The 15625 receptor protein polynucleotides are useful for generating
                                                                                                                                                                                            The 15625 receptor protein polynical cotides are useful for generating probes, primers and antisense constructs. The polynical cotides encoding the 15625 receptor proteins can also be inserted into vectors to be used in gene therapy. The disorder that may be treated using the 15625 receptor protein polynical cotides and polypeptides include anaemia, neutropenia and thrombocytopenia.
                                                                                                                                                                                                                                                                                                                                                                                            Identifying an agent modulating the level or activity of G-protein coupled receptor useful for screening a cell derived from a subject having disorders such as anaemia, neutropenia and thrombocytopenia
                                                                                                                                                                         Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ₽
                      The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity tissue growth factor activity, immunomodulatory activity and activity in the diagnosis and/or activity activity and may be useful in the diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                 20-JUN-2000;

                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                    Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to ADP (adenosine 5'-diphosphate) receptor, termed Cas P2Y12 receptor and its corresponding cDNA molecule. P2Y12 receptor is corresponding cDNA molecule. P2Y12 receptor is corresponding cDNA molecule. P2Y12 receptor is expressed CC selectively in the platelets and brain, and couples to a pertussis toxin-CC sensitive G protein (Gi). P2Y12 receptor is a G protein-coupled receptor that responds to ADP. The invention also relates to a method for CC infarction, unstable angina, chronic stable angina, transient ischaemic CC infarction, unstable angina, chronic stable angina, transient ischaemic CC attacks, strokes, peripheral vascular disease, precelampsia, deep venous CC thrombosis, embolism, disseminated intravascular coagulation, thrombotic CC thromboytopaenic purpura or a bleeding disorder; thrombotic and CC restentic complications following anaioplasty, carotid endarterectomy, CC post CABG (coronary artery bypass graft) surgery, vascular graft surgery, carotid endarterectomy cost cabg (coronary artery bypass graft) surgery, vascular graft surgery, CC stent placements or insertion of endovascular devices and prostheses. CP2Y12 receptor is useful for identifying binding partners and for CC diagnostic applications. P2Y12 receptor provides targets for screening CC synthetic small molecules and combinatorial or naturally occurring CC synthetic small molecules and combinatorial or naturally occurring compound libraries to regulate platelet aggregation, vascular injury, or CC disease as well as schizophrenia, eating disorders, depression, migraine CC and other brain disorders. The present sequence is human P2-purinergic creating compound is a combinatoral platelet aggregation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The method is used for screening for antiplatelet agents, which can then be used for treating e.g. thrombotic or ischaemic diseases.
                                                                                                                                                                                                                                                                                                Sequence

                                                                                                                       The invention relates to identifying an ADP-glucose (ADP-G) receptor (a CC protein-coupled receptor) agonist, antagonist or ligand, comprises CC contacting the receptor with one or more candidate compounds so that the CC receptor produces a G protein-coupled signal in response to ADP-G or CC selectively binds ADP-G, and identifying the candidate molecule that CC alters signal production as an agonist, antagonist or binds as a ligand. CC Also included are altering signalling through an ADP-G receptor. By CC contacting a cell expressing the receptor with ADP-G or the ant/agonist, CC ameliorating an ADP-G receptor associated condition, by administering a CC individual and a composition comprising ADP-G or the ant/agonist to an CC individual and a composition comprising the ADP-G receptor and ADP-G composition induces vasorelaxation. The new methods are CC therapeutic composition induces vasorelaxation. The new methods are CC useful in identifying ant/agonists and ligands of the receptor. CC The ant/agonists are useful therapeutically for preventing or ameliorating conditions associated with the receptor such as CC cardiovascular disorders (e.g. ischaemia, hypertension, hypotension, CC angina pectoris, myocardial infarction, orthography congestive heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; ADP-glucose; receptor; G protein-coupled receptor; agonist; antagonist; cardiovascular function disorder; vasorelaxation; asgonist; antagonist; cardiovascular function disorder; diarrhoea; ischaemia, angina pectoris; gastrointestinal disorder; disorder; immune disorder; immunodeficiency disorder; autoimmune disorder; rheumatoid arthritis; bacterial infection; viral infection; fungal infection; protozoal infection; respiratory disorder; asthma; kidney disorder; glomerulonephritis; hepatobiliary disorder; cirrhosis; endocrine disorder; adrenal dysfunction; musculoskeletal disorder; endocrine disorder; adrenal dysfunction; musculoskeletal disorder;

The gene for the ADP-G receptor is located on chromosome 3 in a region associated with Usher syndrome type 3 (progressive hearing loss). The ligand is useful therapeutically, in detecting normal or abnormal expression of the receptor in an isolated sample or in in vivo diagnostic imaging procedures, and targeting specifically a diagnostic group to cells and tissues that express the receptor. The present sequence represents the

                                                                                                                 Š
                                                                                                                                                                                                                                                             The present invention describes a method for identifying agonists and CC antagonists of mammalian G-Protein Coupled Receptor (GPCR) SP168 which CC may be used to treat neurodegenerative disorders. The method comprises: CC (a) contacting a mammalian SP168 receptor (or a functional fragment) in CC the presence of a known amount of a labeled SP168 receptor ligand with CC a sample to be tested for the presence of the SP168 receptor agonist or CC antagonist; and (b) measuring the amount of labeled SP168 ligand CC specifically bound to the receptor (the SP168 receptor agonist or CC antagonist in the sample is identified by measuring the difference in CC binding of the labeled SP168 receptor ligand to the receptor, compared CC to what would be measured in the absence of such agonist or antagonist). The method is used to detect agonists and antagonists (especially CC antibodies) of the SP168 GPCR which may be used to treat a neurodegenerative disorder, such as Parkinson's Disease, Allas) and CC multiple sclerosis (MS) in mammals, especially humans. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    В
                   This invention describes a novel human platelet-activating factor (PAF) receptor-3 (PAFF-3) gene (I). The protein encoded by (I) probably modulates the activity of PAF, which is involved in many (patho)physiological processes e.g., thrombocyte activation, hypotension, increased vascular permeability, bronchoconstriction etc. (I), and derived (anti)sense oligonucleotides, are useful in the treatment and diagnosis of (I)-related diseases; for producing transgenic/knockout animals, and for recombinant expression of the protein (II) that it encodes. (II) is useful in ligand-binding studies and screening assays, also for treatment and diagnosis of (II)-related diseases. This sequence represents the human platelet-activating factor receptor (PAFR-3) protein described in the invention.

The 15625 receptor protein is a novel G-coupled protein receptor (GPCR). The cDNA for this protein was isolated by screening a human cDNA library with sequences homologous to other GPCRs. The 15625 receptor protein is expressed in the glial cells of the brain. It is also expressed in several other tissues. The 15625 receptor protein may be useful for producing antibodies which can be used to detect the presence of the receptor protein. The 15625 receptor protein polynucleotides are useful for generating probes, primers and antisense constructs. The polynucleotides encoding the 15625 receptor proteins can also be inserted into vectors to be used in gene therapy. The disorder that may be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC The invention relates to ADP (adenosine 5'-diphosphate) receptor, termed CC as P2Y12 receptor and its corresponding CDNA molecule. P2Y12 receptor is case 12Y12 receptor and its corresponding CDNA molecule. P2Y12 receptor is case 12Y12 receptor is expressed CC selectively in the platelets and brain, and couples to a pertussis toxin CC sensitive G protein (Gi). P2Y12 receptor is a G protein-coupled receptor CC that responds to ADP. The invention also relates to a method for CC infarction, unstable angina, chronic stable angina, transient ischaemic CC infarction, unstable angina, chronic stable angina, transient ischaemic CC attacks, strokes, peripheral vascular disease, precelampsia, deep venous CC thrombosis, embolism, disseminated intravascular coagulation, thrombotic CC restenotic complications following angioplasty, carotid endarterectomy, CC post CABG (coronary artery bypass graft) surgery, vascular graft surgery, CC stent placements or insertion of endovascular devices and prostheses. CC P2Y12 receptor is useful for identifying binding partners and for CC disease as well as schizophrenia, eating disorders, depression, migraine CC compound libraries to regulate platelet aggregation, vascular injury, or Cd disease as well as schizophrenia, eating disorders, depression, migraine CC and other brain disorders. The present sequence is a fragment of human CC P2-purinergic receptor subtype, referred as P2Y12.

The present sequence is the protein sequence for murine G protein-coupled CC receptor (GPCR) protein, IGPCR17. The coding sequence for IGPCR17 is CC useful in gene therapy for prevention, amelioration or treatment of CC diseases characterised by aberrant expression or activity of IGPCR17, CC where the disease is a psychiatric or central nervous system (CNS) CC disorder associated with signal processing in CNS such as learning and CC syndrome, Parkinson's disease, Huntington's disease, dyskinesias, CC dystonia, pain and spasms. In addition, IGPCR17 and its coding sequence CC are useful in diagnosis, prevention, amelioration or treatment of CC diseases associated with signal processing in CNS, schizophrenia, CC episodic paroxysmal anxiety (EPA) disorders such as obsessive compulsive CC diseases associated with signal processing in CNS, schizophrenia, CC disease, kidney diseases such as renal failure, obesity, CC disease, motility diseases such as irritable bowel syndrome (IBS), cC diarrhoea, motility disorders and conditions of delayed gastric emptying, osteoporosis, infections such as bacterial, fungal, protozoal and viral confections, asthma, allergy, arthritis, sepsis and gynecological

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                В
                               The invention relates to ADP (adenosine 5'-diphosphate) receptor, termed CC as P2Y12 receptor and its corresponding cDNA molecule. P2Y12 receptor is the subtype of P2-purinergic receptor. The P2Y12 receptor is expressed CC selectively in the platelets and brain, and couples to a pertussis toxin-CC sensitive G protein (Gi). P2Y12 receptor is a G protein-coupled receptor CC that responds to ADP. The invention also relates to a method for CC infarction, unstable angina, chronic stable angina, transient ischaemic CC infarction, unstable angina, chronic stable angina, transient ischaemic CC attacks, strokes, peripheral vascular disease, precelampsia, deep venous CC thrombosis, embolism, disseminated intravascular coagulation, thrombotic CC thrombosis, embolism, disseminated intravascular coagulation, thrombotic CC restenotic complications following angioplasty, carotid endarterectomy, CC post CABG (coronary artery bypass graft) surgery, vascular graft surgery, CC stent placements or insertion of endovascular devices and prostheses. CC P2Y12 receptor is useful for identifying binding partners and for CC adagnostic applications, P2Y12 receptor provides targets for screening CC compound libraries to regulate platelet aggregation, vascular injury, or Cd disease as well as schizophrenia, earting disorders, depression, migraine CC and other brain disorders. The present sequence is rat P2-purinergic CC receptor subtype, referred as P2Y12 receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 15

                       Sequence 1, Application US/0984889

Patent No. US20020025555A1

GENERAL INFORMATION:

APPLICANT: Au-Young, Janice
APPLICANT: Cheng, Muzong
TITLE OF INVENTION: GPCR DIAGNOSTIC FOR BRAIN CAN
FILE REFERENCE: PC-0042 CIP
CURRENT APPLICATION NUMBER: US/09/848,889

CURRENT FILING DATE: 2001-05-03

NUMBER OF SEQ ID NOS: 12

SOFTWARE: PERL Program

SEQ ID NO 1

LENGTH: 333
TYPE: PRT
ORGANISM: Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ; NUMBER OF SEQ ID NOS: 2

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Database : SwissProt_40:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                FUNCTION: Receptor for ADP and ATP coupled to G-proteins that inhibit the adenylyl cyclase second messenger system. Not activated by UDP and UTP. Involved in platelets aggregation. SUBCELLULAR LOCATION: Integral membrane protein.

TISSUE SPECIFICITY: Highly expressed in the platelets, lower levels in the brain. Lowest levels in the lung, appendix, pituitary and adrenal gland. Expressed in the spinal cord and the fetal brain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS
